

## Winning Formula In Eliminating Slow Growth Rate And Pot-bellies in Calves

### Description

When calves stop taking milk from their mothers at the age of 3 months, the following challenges are normally observed;

• Slow growth rate

• Emaciation

• Pot-belly development

These challenges are as a result of change in feeds from the highly nutritious milk to the locally available forages that are deficient in the most essential nutrients.

This is the winning formula for overcoming the above challenges;

• Introduce Ndamaplus® when the calf hits 3 months of age.

• Continue using Ndamaplus® till she hits 6 months of age.

• Skip 3 months, 6th, 7th and 8th month.

• Reintroduce Ndamaplus® to the calf during the 9th to 12th month of age.

• At the age of 14 months and 1 week, introduce Fertility+® to her for 18 days.

• Congratulations! At exactly 15 months of age, your heifer will have attained a minimum of 300 Kilograms and she will come on heat and conceive!
