Ndamaplus®: 3-in-1 Rapid Calf Growth Accelerator (Stops Pot-Bellies)

Description

Ndamaplus®: 3-in-1 Rapid Calf Growth Accelerator

Is your calf developing a large **pot-belly** instead of growing tall? Stunted growth (known locally as *Kudumaa*) is the silent enemy of your future dairy herd.

Many farmers feed their calves well, yet the animals remain short, with rough coats and swollen bellies. This happens when a calf fills up on fiber but lacks the exact nutritional engine needed to build bone and muscle. It is not just a cosmetic issue; you need a proven accelerator to turn that feed into physical size.

Enter Ndamaplus®: The Proven Calf Growth Solution

Powered by our proprietary **RestoreX® Technology**, Ndamaplus® is an advanced high-protein, energy, and trace element supplement specifically formulated to turn your calves into strong, heavy heifers faster. Stop raising stunted calves and start building a high-production herd today.

What RestoreX® Technology Does for Your Calves:

Rapid Skeletal Growth (Height, Not Fat): A short, fat calf is not a good dairy cow. Ndamaplus® delivers the exact targeted energy and trace elements required to stretch the bones, build a deep rib cage, and help your heifers reach their target breeding weight (350kg+) months earlier.

Eliminates Pot-Bellies & Maximizes Digestion: Turn cheap forage into solid growth. Our specialized rumen-feed components ensure your calf breaks down complex fibers (like Napier grass or sweet potato vines) efficiently, flattening the pot-belly and squeezing maximum nutrition out of every single bite.

The Ultimate Immunity Shield: Fortified with essential vitamins and trace elements, it builds an

internal shield against pneumonia and scouring. Watch rough, staring, brownish coats turn into shiny, healthy fur within weeks.

The Economics of Early Maturity: Why Speed Matters

Why feed an animal for 3 years before it gives you a single drop of milk? Slow-growing heifers are "dead capital." By bridging the nutritional gap with Ndamaplus®, you can serve your heifers at 15-18 months. You save an entire year of feed costs and get milk in the bucket a full year sooner.

Simple, Effective Application

No special equipment is required. Simply mix the powder thoroughly with calf pellets (dairy meal) in the morning, or dust it directly onto wet forage (like sweet potato vines or silage) so it sticks.

Stage 1 (Calves 1 to 3 Months): Mix 12.5 grams (1 Teaspoon) per calf into their daily feed.

Stage 2 (Calves 3 to 15 Months): Increase to 25 grams per calf every day.

Rescue Protocol (Stunted Heifers): If your heifer is older than 15 months but still weighs below 250kg, feed 25 grams daily until she reaches the target bulling weight.

The 90-Day Transformation Program

For maximum results, do not skip days. Constant availability of these high-energy and trace elements is required for steady bone growth. Commit to a continuous 90-day feeding cycle. Consistent daily use over 90 days completely transforms a stunted, pot-bellied calf into a tall, vigorous heifer ready to catch up to her breeding weight.

Pack Sizes to Fit Your Herd

Minipack (0.4 kg) KSh 1,250: Lasts for 16 days at the standard 25g dose.

Standard Pack (0.75 kg): Lasts for 30 days at the standard 25g dose.

Trust the Source

Ndamaplus® is manufactured by **Dairyverse Agritech Ltd.** We provide science-based animal nutrition you can trust, tailored specifically to solve the unique challenges of East African dairy farming.

Frequently Asked Questions (FAQs)

Q: My calf has a big "pot-belly" but isn't growing tall. Is this right for me?

A: Absolutely. A pot-belly is the classic sign of Kudumaa (stunted growth) and poor digestion. It means the calf is eating fiber but not absorbing the nutrients to grow. The high-protein, energy, and trace elements in RestoreX Technology fix the gut to turn that feed into skeletal height, eliminating the pot-belly appearance.

Q: At what age can I give this supplement to my calf?

A: It is best used during the rearing and weaning phase (1 to 15 months). However, it is highly effective as a "Rescue Protocol" for older heifers that have faced stunted growth and are still below 250kg.

Q: How fast will I see results?

A: You will notice improvements in digestion and coat condition (shinier fur) within weeks. For major structural changes like height and the disappearance of pot-bellies we highly recommend following the 90-Day Transformation Program for the best visible results.

Q: Can I give this to mature milking cows?

A: While 100% safe with zero withdrawal period, this specific formula is balanced for growing bones, not milk production. For milking cows, we recommend switching to our Booster+® or LactoMax programs to sustain high yields.
