

Mbuzipro® (Sheep & Goat Formula)

Description

Maximize Twinning and Rapid Weight Gain with Mbuzipro® Sheep & Goat Supplement

In sheep and goat farming, profitability comes down to two simple things: **how many offspring your animals produce**, and **how fast those animals grow**. Single births and slow-growing kids or lambs eat directly into your profit margins.

Mbuzipro® is a specialized formula designed to multiply your herd faster and get your animals to market weight in record time. Using our unique **7-Day Pulse Feeding method**, you can trigger explosive reproductive results and rapid growth without feeding an expensive supplement every single day of the year.

Enter Mbuzipro®: The Proven Sheep & Goat Accelerator

Powered by our proprietary RestoreX® Technology, **Mbuzipro®** delivers a highly concentrated, rapid-fire burst of high protein, energy, and essential trace elements.

What RestoreX Technology Does for Your Flock:

Boosts Twinning Rates: Stop settling for single births. The targeted trace elements in Mbuzipro® supercharge the reproductive system, drastically increasing the chances of twinning so you can double your herd size and your profits.

Accelerates Weight Gain: Turn cheap forage into heavy meat. Our high-energy formula optimizes digestion, allowing your sheep and goats to extract maximum nutrition from their feed for fast, solid weight gain.

Builds Unbreakable Immunity: Ensure your kids and lambs survive those critical early months. The rapid burst of nutrients creates a strong internal shield against common environmental stresses and diseases.

The 7-Day Pulse Feeding Protocol

You do not need to feed Mbuzipro® every day. For maximum results and maximum cost-efficiency, we use a targeted 7-day treatment cycle.

The Cycle: Feed the daily dose for 7 consecutive days, then stop. Repeat this short 7-day cycle only once every 3 months.

Adult Dosage (Ewes, Does, Rams, Bucks): Feed 32.5 grams (approx. 1.5 Tablespoons) per head, every day for the 7 days.

Kids & Lambs Dosage (4 to 15 Months): Feed $\frac{1}{4}$ of a Tablespoon per head, every day for the 7 days.

Application Tip: Mix the powder thoroughly into a small amount of their favorite dry feed or bran to ensure every animal gets its exact, complete dose.

Pack Sizes Built for Your Herd

Standard Pack (1kg): This pack provides the exact amount needed to treat 4 adult animals for the full 7-day cycle.

Trust the Source

Mbuzipro® is proudly manufactured by **Dairyverse Agritech Ltd.** We provide science-based animal nutrition you can trust, tailored specifically to help East African farmers maximize the commercial value of their sheep and goats.

Frequently Asked Questions about Mbuzipro®

Q: Why do I only feed it for 7 days?

A: Mbuzipro® uses a highly concentrated Pulse Feeding method. The high protein, energy, and trace elements in RestoreX Technology are so potent that a 7-day burst fills the animal's nutritional reserves for an entire quarter. You simply repeat the 7-day cycle every 3 months.

Q: Will this guarantee that my goats or sheep have twins?

A: While genetics play a role, poor nutrition is the number one reason animals only drop one offspring. By flooding the reproductive system with the exact trace elements it needs just before breeding, Mbuzipro® heavily increases the biological likelihood of twinning.

Q: Is it safe for young kids and lambs?

A: Yes, it is highly beneficial for growing animals between 4 and 15 months of age. Simply reduce the dose to ¼ of a Tablespoon per day during the 7-day treatment cycle to accelerate their bone and muscle growth.

Q: Can I feed this to my dairy cows or beef bulls?

A: No. Sheep and goats have very specific trace element requirements (especially regarding copper limits) that differ from cattle. For dairy cows, use Booster+® or LactoMax, and for beef cattle, use Nyamaplus®.
